

Unknown.exe

Jump into code in static disassembly then rename and comment on interesting assembly routines

String Anti Analysis

String stacking: hide strings on the stack (`push` instructions)

```
.text:00401151      push     67616C66h
.text:00401156      push     735F697Bh
.text:0040115B      push     5F796174h
.text:00401160      push     5F74756Fh
.text:00401165      push     5F6F6F74h
.text:0040116A      push     6574616Ch
.text:0040116F      push     746F675Fh
.text:00401174      push     746F6E5Fh
.text:00401179      push     676E696Bh
.text:0040117E      push     5F6E695Fh
.text:00401183      push     625F796Dh
.text:00401188      push     6E696172h
.text:0040118D      push     7Dh ; '}'
```

- Values are little endian, LSB. Hex values appear backwards

Converting values of all sequential pushes from offset `00401151` to `00401188`

```
.text:00401151      push     'galf'
.text:00401156      push     's_i{'
.text:0040115B      push     'yat'
.text:00401160      push     'tuo'
.text:00401165      push     'out'
.text:0040116A      push     'etal'
.text:0040116F      push     'tog_'
.text:00401174      push     'ton_'
.text:00401179      push     'gnln'
.text:0040117E      push     'ni_'
.text:00401183      push     'b_ym'
.text:00401188      push     'nlar'
.text:0040118D      push     '}'
```

Looking for interesting strings

Interesting string: `.rdata:00402064 0000000B C stage2.exe`

- Which code is referencing this string

Reference label: `aStage2Exe`

xrefs menu

Jumping to selected cross reference. Address `sub_401000` will take you to where the string is referenced at `004010B0`.

```
.text:004010B0      push     offset aStage2Exe ; "stage2.exe"
```

Trace back to the Start function

- Following the xrefs of the functions backwards until start function

First location label

```
.text:0040104C loc_40104C:                                ; CODE XREF: sub_401000+48↑j
```

- xref function name to follow the branch or jump instruction (branch or jump instruction is `jbe` or `jmp`)

`loc_40104C` branches to this location

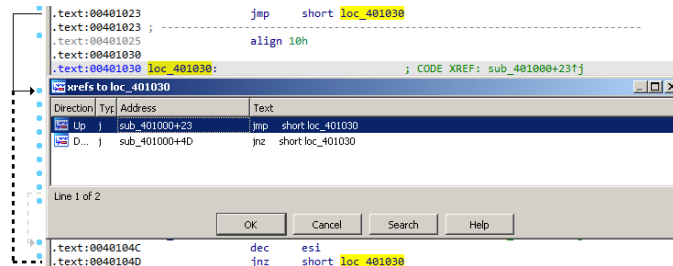

```

.text:00401048      jbe     short loc_40104C
.text:0040104A      xor     al, al
.text:0040104C
.text:0040104C loc_40104C: ; CODE XREF: sub_401000+48↑j

```

*Note: keep track of where these branch statements occur as apart of the flow.

xref next location label

xref subroutine/function

Start function (sub_401000)

```

.text:00401150 start      proc near
.text:00401150      nop
.text:00401151      push   67616C66h
.text:00401156      push   735F697Bh
.text:0040115B      push   5F796174h
.text:00401160      push   5F74756Fh
.text:00401165      push   5F6F674h
.text:0040116A      push   6574616Ch
.text:0040116F      push   746F675Fh
.text:00401174      push   746F6E5Fh
.text:00401179      push   676E6968h
.text:0040117E      push   5F6E695Fh
.text:00401183      push   625F796Dh
.text:00401188      push   6E696172h
.text:0040118D      push   70h ; '}'
.text:0040118F      mov     ecx, 00h
.text:00401194      loc_401194: ; CODE XREF: start+45↑j
.text:00401194      pop     eax
.text:00401195      loop   loc_401194
.text:00401197      call   sub_401000
.text:0040119C      push   0 ; uType
.text:0040119E      push   offset Caption ; "I'm totally malware"
.text:004011A3      push   offset Text ; "totally not malware"
.text:004011A8      push   0 ; hwnd
.text:004011AA      call   ds:MessageBoxA

```

Analyze function sub_401000

- Need to capture when stage2.exe file is created and written

*Note: Remember that functions have their arguments pushed onto the stack before the function is called.

stage2.exe is concatenated together with the string referenced by the register esi

- esi is used as the first argument for `CreateFileA`

```

.text:004010B0      push     offset aStage2Exe ; "stage2.exe"
.text:004010B5      push     esi                ; lpString1
.text:004010B6      call     edi                ; lstrcatA
.text:004010B8      push     0                  ; hTemplateFile
.text:004010BA      push     80h                ; dwFlagsAndAttributes
.text:004010BF      push     2                  ; dwCreationDisposition
.text:004010C1      push     0                  ; lpSecurityAttributes
.text:004010C3      push     0                  ; dwShareMode
.text:004010C5      push     40000000h          ; dwDesiredAccess
.text:004010CA      push     esi                ; lpFileName
.text:004010CB      call     ds:CreateFileA

```

Push instructions = arguments

Function called: `CreateFileA`

esi register containing the new string is used as an argument for a call to `CreateProcessA`

```

.text:00401113      push     ecx                ; lpProcessInformation
.text:00401114      lea     edi, [ebp+StartupInfo]
.text:00401117      push     edi                ; lpStartupInfo
.text:00401118      push     0                  ; lpCurrentDirectory
.text:0040111A      push     0                  ; lpEnvironment
.text:0040111C      push     0                  ; dwCreationFlags
.text:0040111E      push     0                  ; bInheritHandles
.text:00401120      push     0                  ; lpThreadAttributes
.text:00401122      push     0                  ; lpProcessAttributes
.text:00401124      push     esi                ; lpCommandLine
.text:00401125      mov     eax, 5
.text:0040112A      push     esi                ; lpApplicationName
.text:0040112B      mov     [ebp+StartupInfo.cb], 44h ; 'D'
.text:00401132      mov     [ebp+StartupInfo.wShowWindow], ax
.text:00401136      call     ds:CreateProcessA

```

Interesting routines using control flow instruction (branch, jumps, calls)

Mapping

- Start
- Call `401000`
- Jmp `@401023`
- Jbe `@401048`
- Createfile `@4010CB`
- Create Process `@401136`

Other interesting API function patterns:

- Opening a file from the resource section
- FindResource
- SizeofResource
- LoadResource
- LockResource
- Creating a file
- GetEnvironmentVariable
- CreateFile
- WriteFile
- CloseHandle
- Sleep
- Starting a new process
- CreateProcess
